The EAN/U.P.C. barcode has offered price lookup functionality for decades. However, the classic barcode is no longer keeping up with today’s growing demands for greater product information transparency, traceability, and authentication.

Thus, industry is moving toward two-dimensional (2D) barcodes that are able to carry more information. 2D barcodes allow for a single standardized way to meet both supply chain needs and evolving consumer requirements.

The information carried by 2D barcodes can also help enable:
- Improved inventory management
- Enhanced recall readiness
- Greater sustainability and ethical sourcing practices
- Better product authentication
- Greater brand trust

Industry has set a date to make the transition to accepting 2D barcodes at point-of-sale (POS)—referred to as **Sunrise 2027**.

GS1 US® is helping both supply- and demand-side organizations and solution providers get started with a migration path toward the “next dimension” of barcodes.

### Moving Toward the Sunrise

Transitioning to 2D barcodes for POS is a multi-step process. The GS1 US Sunrise 2027 initiative lays out a plan to help ensure 2D barcodes will be usable at any retail POS by the end of 2027. It is imperative that GS1, as a neutral global standards body, coordinate this effort to ensure that recommendations and guidance include the needs of all stakeholders to help produce a fully interoperable solution that will work for all parties in the value chain.

### Retail Requirements

To prepare for Sunrise 2027, retail POS systems must be transformed to process 2D barcodes and continue to have efficient checkout capabilities. At minimum, price lookup systems need to be able to use the Global Trade Item Number® (GTIN®) encoded in 2D barcodes.
GS1 US Barcode Capabilities Test Kit

The GS1 US Barcode Capabilities Test Kit is used to evaluate baseline functionality and identify gaps in scanning and processing 2D barcodes. This includes scenarios carrying only a GTIN and with GTIN plus additional attributes (e.g., batch/lot #) in a variety of barcodes approved for use in different applications throughout the GS1 System of Standards.

The testing process provides an opportunity to empower brand owners, retailers, and their solution providers to discuss the need to work together to enable a smooth industry transition along the glidepath to Sunrise 2027.

Key Findings from Initial Testing

Some retailers have already used the kit to better understand what their existing systems can and cannot do. Results from this first phase of testing include:

All retailers encountered some issue processing GS1 Application Identifier (AI) data (e.g., expiration date).

- Scanners and/or POS systems are not set up to process and store GS1 AI data.
- For retailers who could process GTIN + GS1 AI data, system limitations prevented processing and storage of all encoded data.

Many of the retailers had image scanners installed. However:

- Although image scanners have the capability to read 2D barcodes, these settings were not turned on.
- Scanners that did have 2D barcode settings enabled still required updates to process advanced syntaxes, including GS1 Digital Link URI, in addition to GS1 AI data, as noted above.

Barcode capabilities testing requires coordination among multiple parties, including retailer POS teams and POS hardware and software providers, who all must be involved to develop interoperable solutions.

Stakeholders need to scan 2D barcodes in systems other than those found at retail POS (e.g., warehouse management and store receiving). A better understanding of these additional use cases is needed to quantify benefits and risks.

GET STARTED ON THE PATH TO SUNRISE 2027

Every company is unique and has different considerations for how to approach moving forward. The GS1 US Barcode Capabilities Test Kit is the first step in developing and deploying an implementation roadmap and can be used to establish a baseline for any system expected to interact with GTINs. The kit can also be used to communicate requirements to your internal development teams and your solution providers.

PLAN

Connect with partners
Assess system readiness using the Barcode Capabilities Test Kit
Determine what you want to test

TEST

Conduct a pilot
Refine based on learning
Develop an implementation roadmap

GO

Implement roadmap
Grow the solution until the new barcode is the norm
Evaluate evolving needs and adjust
