STEP 2: Add results together to create sum
STEP 3: Subtract the sum from the nearest equal or higher multiple of ten $=$ CHECK DIGIT

## EXAMPLE: GTIN-12 (U.P.C.)

The Check Digit for a GTIN-12 (U.P.C.) ID Number is figured using the standard modulo calculation.

## Here is how it works:

## NUMBERING STRUCTURE POSITIONS

## STEP ONE:

Suppose you want to find the Check Digit for the GTIN-12 (U.P.C.)
Number 61414121022. Set up a table with 12 columns, and put the number 61414121022 into Positions One through Eleven. Position Twelve will be blank because it is reserved for the Check Digit.

## STEP TWO:

Add the numbers in Positions One, Three, Five, Seven, Nine, and Eleven:
$(6+4+4+2+0+2=18)$

## STEP THREE:

Multiply the result of Step Two by three: $(18 \times 3=54)$

## STEP FOUR:

Add the numbers in Positions Two, Four, Six, Eight, and Ten: $(1+1+1+1+2=6)$

## STEP FIVE:

Add the results of Step Three and Step Four: (54+6=60)

## STEP SIX:

The Check Digit is the smallest number needed to round the result of Step Five up to the nearest multiple of 10 . In this example, the Check Digit is 0 .
